Puller

- Most of the time we refer to our Puller as Puller Punch Combos because the Nail Hole Punch and the Weep Hole Punch also mount on the Puller.
- This saves a lot of floor space and eliminates the alignment problems of having separate machines.
- Our Pullers are an opposed two wheel design, meaning that there are wheels above and below the part that pinch the material between them to grip the part to pull it.
- All of our Pullers have two sets of puller wheel shafts.
- We offer a variety of different wheels and guides that allow us to pull virtually all of the panels and accessories used in the vinyl siding industry.
- All of the Pullers include stall detection that will turn off the machine after 5 seconds.
